

This

1. Difference between strict mode and non-strict mode
2. In most case, the value of this is determined by **how** a function is **called**
3. This **can't** be **set** by assignment during execution
4. ES6 introduced the **bind()** method to set value of a function's this regardless of how it's called
5. **Arrow** function **don't** provide **bind** this. It retains the this value of the enclosing lexical context
6. In **global context** (out side any function), this **refers** to **global object** whether in strict mode or not (window for web browser, and global for node)
7. In the **function context**, the value of this depends on **how** the function is **called**
- 8.
