

# Javascript Note (ES6)

1. Variable are case insensitive (phân biệt hoa thường)
2. "use strict" must be placed at the **beginning** of file (for global) or function (for local)
3. Hoisting: **NOT IN STRICT MODE or LET**. JavaScript moves the **declarations not initialization** to the top by default. That applied to **variables** and **functions**.

Thanks to hoisting, we can use a component (variables, functions) before it has been declared.

4. **Var** is **function** scope. **Let** is **block** scope (the code inside {})

Var	Let	Const
Function scope	Block scope	Block scope
Can redeclared a variable in the same place	Can't redeclared a variable in the same place	Can't redeclared a variable in the same place
		Can't reassigned
		Must be initialized during its declaration
		value assigned to a constant is immutable (except reference type)
